

Maximizer - Filter Address Book Entries Using User-Defined Fields

Last Modified on 03/16/2020 3:27 pm EDT

Querying address book entries by User Defined Fields comes with some peculiarities that we would like to cover up in this article:

- In order to query for a User Defined Field that does not contain any special characters, spaces etc. in its structure, the format is the following:

```
Udf.VWRmRGVmaW5pdGlvbGk2MDAzMAkw='5'
```

- User Defined Fields that contain special characters need to be rounded with backticks in a query to preserve their structure as it is when passing the request to the provider. For example:

```
`Udf.$NAME(<>)`='60003'
```
