

# Sharepoint - How to Use a Delegate User

Last Modified on 05/13/2020 6:29 pm EDT

A delegate user can authenticate a Sharepoint connector instance by using the field "Use Scope" set as false. Also, if the delegate user has access to a new Sharepoint app, the new Sharepoint app must first have successfully API calls made by the administrator of the Azure Active Directory where the application was created. A single admin call "activates" the API for other users.
