

Intro: Building a Connector with Connector Builder

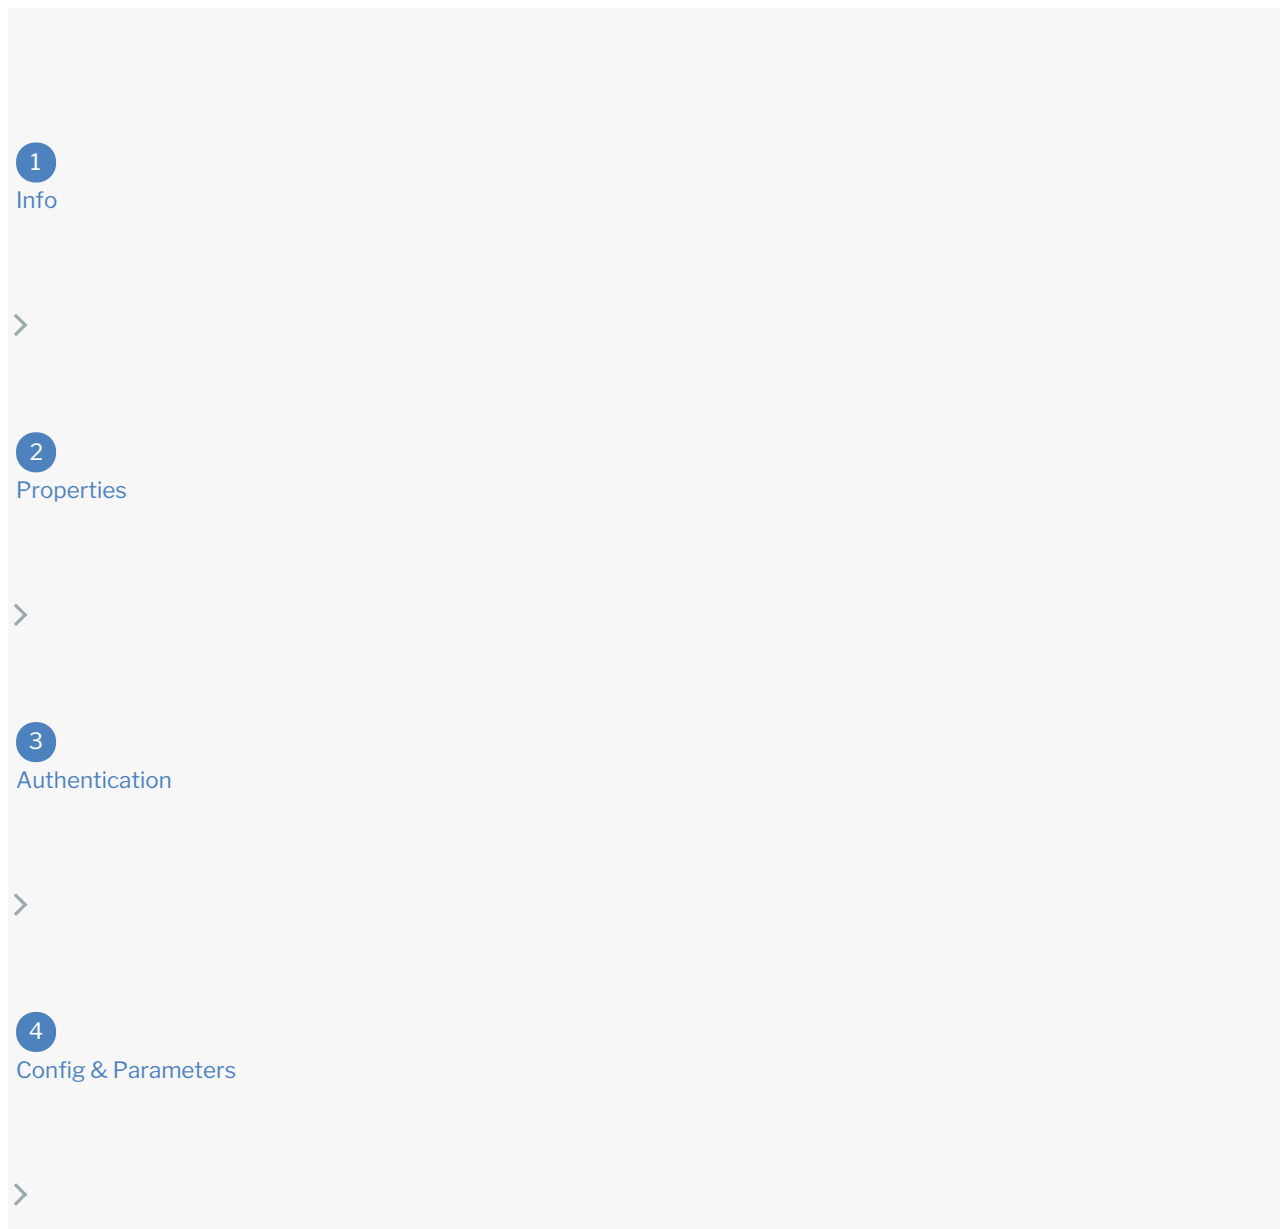

Last Modified on 09/22/2020 9:55 pm EDT

On this page

Building a connector is a multi-step process that you likely won't complete in a single sitting. We've broken the steps up in this section in separate topics linked from this topic. Here, we'll get you started and give you a high level overview of how to build a connector.

The Workflow

While you can work on different parts of a connector throughout the entire creation process, in general you will follow the high-level workflow shown below.

5

Hooks

Resources

Information

Setup

Resources

1

Information tab. Define the basic connector information (name, key, description, authentication type, API type, documentation URL, API version, and image).

Information

Setup

Resources

2

Setup tab, Properties section. Configure the connector properties (base URL, pagination, and header information).

3

Setup tab, Authentication section. Set up authentication information based on authentication types.

4

Setup tab, Configuration and Parameters sections. Define the configurations and related parameters needed to authenticate.

5

Setup tab, Hooks section. Write custom pre-request and post-request hooks.

6

Setup tab, Events section. Set up polling or webhook events.

Information

Setup

Resources

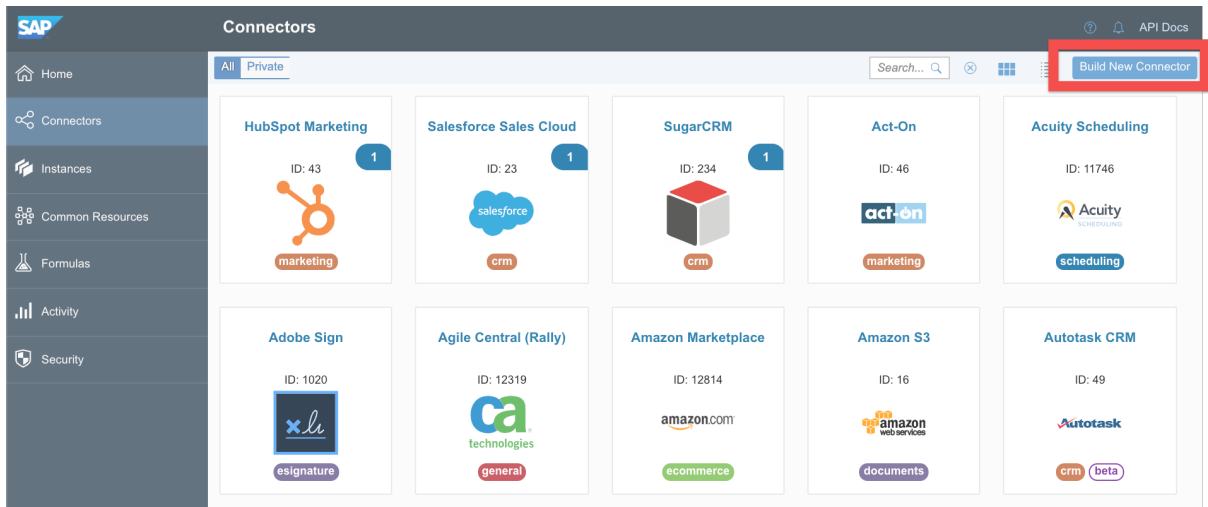

7

Resources tab. Define the API provider resources to connect to.

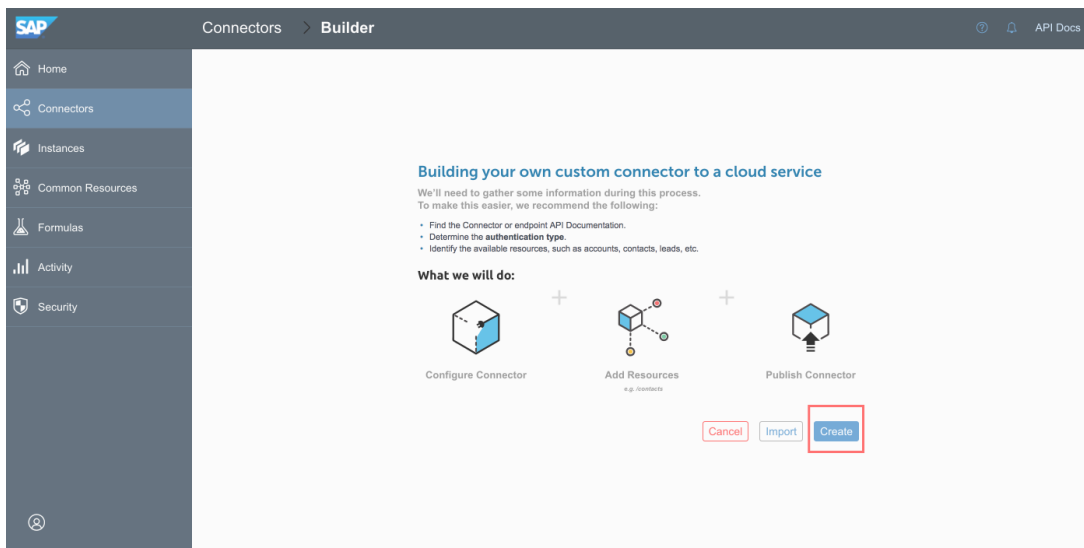

Get Started

To begin building a connector:

1. On the Connector Catalog page, click **Build a New Connector**.

2. On the Builder page, click Create.

3. Complete the Information tab.
