Fortnox API Provider Setup
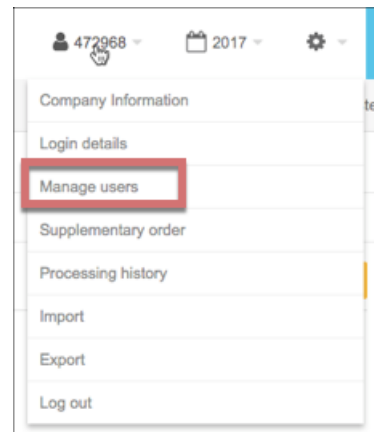

API Provider Setup

To authenticate a Fortnox connector instance you must use the **Client Secret** associated with your app and the **Authorization Code** of your integration.

See the latest setup instructions in the Fortnox documentation.

1. Complete the New Integration form.
2. Record the **Client-Secret** that Fortnox provides.
3. Publish the integration to make it available to your customers.

4. Log in to Fortnox account and then select **Manage Users** from the profile list.
5. At the bottom of the page, click **Add Integration** and locate your integration by Client ID.
6. After you connect, record the API code. This is the **Authorization Code** needed to authenticate.

You can use each authorization code only once and must generate a new one for each authenticated connector instance.
