

Search Custom Fields

Last Modified on 11/09/2018 5:32 pm EST

SAP Cloud Platform Open Connectors supports searching on the following types of custom objects:

- boolean
- long
- string
- multiselect
- enums

Note: You can search on only one custom field at a time.

To search on custom fields, add `custom.` to the field reference and value in your `where` clause. Also, use the backtick (```) symbol to enclose the field reference. For example:

- To search on a custom boolean field:

```
`custom.boolean.scriptId` = 'custentity_2663_direct_debit' and `custom.boolean.value` = 'false'
```

- To search on a custom multiselect field:

```
`custom.multi.scriptId` = 'custentity_2663_direct_debit' and `custom.multi.value.internalId` = 1
```

- To search on a custom long field:

```
`custom.long.scriptId` = 'custentity1' and `custom.long.value` = 1000
```
