

# Update Custom Fields

Last Modified on 03/06/2019 1:40 pm EST

When you make PATCH or POST API calls and need to update custom fields, you need to include a `customFieldList` and specify the `ce_type`.

SAP Cloud Platform Open Connectors supports the following `ce_type` values:

- SelectCustomFieldRef
- date
- long
- integer
- float
- double
- boolean
- string

In addition to the your `ce_type`, the payload must also contain the `scriptId`, which is the unique identifier of the custom field.

The following example shows how to include a `customFieldList` in the JSON body of a PATCH or POST request.

```
{
  "customFieldList": {
    "customField": [
      {
        "scriptId": "custentity7",
        "ce_type": "SelectCustomFieldRef",
        "value": {
          "internalId": "1"
        }
      }
    ],
    "customField": [
      {
        "scriptId": "custentity9",
        "ce_type": "date",
        "value": "2015-06-25T07:00:00Z"
      }
    ]
  }
}
```
