

# Search Using internalId

Last Modified on 11/09/2018 5:33 pm EST

Each object has its own `internalId` , but you can still search for more than one object by replacing `internalId` with the object name.

For example, if an entity has an internalId of 1769, and a salesRep has an internalId of 36, you can include `entity=1769` or `salesRep=36` in a query.
