

How to Export an Element Instance

Last Modified on 02/12/2019 4:11 pm EST

Use the `GET /instances/{id}` endpoint to export a connector instance in JSON format. For example,

```
curl -X GET
"https://api.openconnectors.us2.ext.hana.ondemand.com/elements/api-
v2/instances/{{INSTANCE ID}}" -H "accept: application/json" -H
"Authorization: User {{USER TOKEN}}, Organization {{ORGANIZATION
TOKEN}}"
```

You can also make the call in our API docs. To export a connector:

1. Go to the SAP Cloud Platform Open Connectors Platform API docs page.
2. On the Instances tab, use the `GET /instances/{id}` endpoint to retrieve the instance JSON.
