

# Microsoft Dynamics CRM - How to Create and Associate an Email Activity to a Contact

Last Modified on 03/22/2019 3:09 pm EDT

To create the activity object, first POST to the appropriate activity type. In this example, it is *email*. The following **POST** works:

```
POST /{objectName} where objectName=email
{
  "attributes":{
    "activitytypecode":"email",
    "description":"EMAIL BODY!!!"
  }
}
```

Then, to create the association to the contact, execute a **PATCH** `/contacts/{id}` with the following json body:

```
{ "action": "associate", "association": { "entity": "email", "id": "bf027250-a2b5-e611-80e4-c4346bacaac0", "associationName": "Contact_Emails" } }
```
