

Performing REST Calls for Workday Operations

Last Modified on 03/07/2019 5:16 pm EST

Workday offers over 1,800+ operations, and SAP Cloud Platform Open Connectors's Workday connector provides a generic way for you to perform REST calls and metadata for each, presuming you have sandbox privileges.

- You can pull the native Workday operations via `GET /objects?fetchAll=true`. The operations take the format `Service$Operation`. See [Workday Web Services Directory](#).
 - You can pull metadata on the native Workday operations via `GET /objects/{objectName}/metadata API`.
 - You can perform CRUDS operations using the `on` native Workday object name.
-
