

NetSuite - Converting Custom Records from Custom Lists

Last Modified on 03/16/2020 3:16 pm EDT

The Custom-List resource allows you to both retrieve information about custom lists and any records associated with the custom list. To retrieve all of your custom lists, you can use the *GET /custom-lists* endpoint. Using the ids, use the *GET /custom-lists/{id}* endpoint to retrieve all of the custom records associated with that list.

Finally, you can convert your custom list into a custom record using NetSuite's UI. From customization>Lists, Records, Fields> Lists> {Your List Name}, you are able to select the **CONVERT TO CUSTOM RECORD** option. Now you can use your custom list in the */custom-record-type/{typeId}/custom-records* endpoint.
