

Evernote - Why is the File Size in GET /files/{id}/metadata Different from the Returned File Size in GET /files/{id}?

Last Modified on 03/16/2020 3:22 pm EDT

The reason why you'll see a different size value in `GET /files/{id}` is because the value returned is from the binary file data itself. In `GET /files/{id}/metadata`, the size value you see is from the resource metadata and does not contain the binary file data.
