Salesforce Files - "path" Parameter

Last Modified on 03/16/2020 3:30 pm EDT

The Salesforce Files connector can be used when uploading files for a Salesforce Files account. This connector works with the SFDC chatter files system and this does not support a folder structure system. This means that the "path" parameter refers only to the file name and its extension and not the folder structure where the file is being uploaded.

If you are interested in working with a folder system, we offer the Salesforce Libraries connector, which invokes the SFDC content management system (ContentDocument, ContentWorkspace, etc).
