

Requirements for Adding Webhook Support

Last Modified on 03/30/2021 8:55 am EDT

When adding support for events to a custom connector, an event hook is typically used to format the incoming event (webhook) into the format SAP Open Connectors expects.

A single event object should contain:

```
{
  "event_date": ,
  "event_object_id": ,
  "event_type": ,
  "event_object_type":
}
```

In the event hook, pass an array of event objects to the done function like so:

```
done({ "events": });
```
